Nguyễn Tuấn Anh

Devops Intern

0943338805 maituananh03052004@gmail.com Hà Nội, Việt Nam

SUMMARY

I am an aspiring DevOps Engineer, proactive and ambitious, with hands-on experience gained through self-driven projects using CI/CD, Docker, Terraform, GitHub Actions, Kubernetes, and AWS. Although I am new to real production systems, I take initiative in learning and continuously improving, and I am eager to contribute and grow in a DevOps environment.

EDUCATION

Academy of Cryptography Techniques (KMA) — Hanoi, Vietnam October 2022 - Present

Information Technology

Fourth-year student majoring in Information Technology.

SKILLS

CI/CD & Automation	GitHub Actions, CI/CD Pipelines, Automation Workflows
Containerization	Docker, Docker Compose, Multi-container Deployment
Cloud (AWS)	EC2, EKS, IAM, VPC, ECR, S3, Load Balancer, Security Groups
Infrastructure as Code	Terraform (VPC, Subnets, NAT Gateway, Route Tables, EKS, IAM)
Orchestration & Deployment	Kubernetes (EKS), Helm Charts, Ingress Controller
Version Control	Git, GitHub (branching, workflow automation, secrets management)
Scripting	Bash, YAML, Environment Variables, SSH Keys
Operating Systems	Linux (Ubuntu server), Shell Operations

PERSONAL PROJECT

Automated CI/CD & GitOps Deployment on AWS EKS August 2025 - October2025

An automated cloud-native infrastructure & deployment pipeline using Terraform, GitHub Actions, Docker, ECR, Helm, and Kubernetes.

GitHub:

- **IaC Repo**: https://github.com/TaThieungu/iac-gitops
- **GitOps Repo**: https://github.com/TaThieungu/vprofile-action
- Built cloud infrastructure using Terraform (VPC, Subnets, NAT, Route Tables, Security Groups, EKS, Node Groups).
- Designed a complete CI/CD pipeline on GitHub Actions:
- Test: Maven test, Checkstyle, SonarCloud Quality Gate.
- Build: Dockerized Spring application & pushed images to Amazon ECR.
- Deploy: Automated deployment to EKS using Helm Chart with rolling updates.
- Configured GitOps workflow with separate IaC and application repos.
- Set up IAM, GitHub Secrets, Kubernetes regcred for secure ECR image pulling.
- Implemented Ingress Controller, mapped Load Balancer DNS to domain, and deployed application at: http://tathieungu.space.
- Cleaned environment by removing Ingress & running terraform destroy to ensure reproducible infrastructure.

Achievement:

- Delivered an end-to-end, production-grade DevOps pipeline across AWS, Kubernetes, GitHub Actions, Docker, Helm, and Terraform.

Fullstack CI/CD Deployment with Docker & AWS EC2 July 2025 - August 2025

A lightweight automated deployment pipeline for a fullstack application using Docker, Docker Compose, GitHub Actions, Docker Hub, SSH, and AWS EC2.

GitHub:

- **Project Repo:** https://github.com/TaThienngu/deloy-fullstack_app_local

Responsibilities:

- Containerized backend, frontend, and MySQL database using Dockerfile & Docker Compose.
- Built a CI/CD pipeline on GitHub Actions to:
- Build Docker images
- Push images to Docker Hub
- SSH into EC2 and auto-deploy using Docker Compose
- Provisioned and configured AWS EC2 (Ubuntu) for deployment: Docker, Compose, folders, permissions, SSH keys.
- Managed deployment credentials via GitHub Secrets (Docker Hub token, private SSH key, server host/user).
- Enabled rapid redeploy by reusing the same private deploy key across new EC2 instances.

Achievement:

- Successfully automated local → Docker → CI/CD → EC2 deployment pipeline for a real fullstack (Spring Boot + Angular + MySQL) system.
